APPLICATION IMPLEMENTATION MANAGER

MAVIM APPLICATION IMPLEMENTATION MANAGER

CAPTURE, SHARE AND VALIDATE ERP BUSINESS PROCESSES AND REQUIREMENTS TO GENERATE A BLUEPRINT FOR ERP IMPLEMENTATIONS

Gartner research shows that 75-80% of the ERP implementations fail to achieve desired results. Often, these projects run out of time, budget, or with an end result that does not meet the customer's expectations. Traditionally during ERP implementations, the emphasis lies on functionality and technology rather than the impact it will have on an organization's people and processes. Utilizing Mavim for Application Implementation Management allows organizations to achieve a more successful balance among people, processes, and technology.

Mavim accelerates ERP implementations by providing a systematic approach to defining, analyzing, improving and communicating business processes throughout an organization. The Mavim software offers a collaborative modelling environment and communication platform which supports the implementation and setup of an integrated ERP solution during its entire lifecycle. The Mavim platform provides an optimal environment for teams to capture, share and validate ERP business processes and process requirements in order to generate a business blueprint for ERP implementations. These business blueprints help to articulate the business requirements before, during, and after the design phase. This will not only accelerate your implementation, but will also minimize risk, increase user adoption and ultimately result in an improved return on investment.

Process activities are connected to the relevant ERP transactions to ensure user adoption during the go live and post go-live phases of the implementation. The business processes will help guide end-users through their work in connection to the ERP solu-

tion. Finally, publication via your Intranet or SharePoint/Office365 portal allows you to communicate the new processes, connected roles and ERP transactions to end-users. This helps create organization-wide awareness and ensures user buy-in. With Mavim's collaborative portal functionalities, end-users are prompted to give feedback and follow-up throughout the process, which drives continuous improvement. Mavim can be seamlessly integrated with Microsoft Dynamics, Infor and SAP.

The Benefits of Mavim for Application Implementation Management

Create Predictable Outcomes

Mavim for Application Implementation Management creates predictable outcomes of ERP implementations by providing a systematic approach to defining, analyzing, improving and communicating business processes throughout an organization. Business blueprints, which provide a complete overview of the current and desired way of working, help create context for the implementation as it happens. These business blueprints help to articulate the business requirements before, during, and after the design phase.

Drive Time to Value

Mavim allows organizations to stay within time, budget, & scope for ERP implementations. The Mavim platform allows teams to capture, share and validate ERP business processes and process requirements in order to generate a business blueprint for ERP implementations. These business blueprints help to articulate the business requirements before, during, and after the design phase.

This will not only accelerate your implementation, but will also minimize risk, increase user adoption and ultimately result in an improved return on investment.

Manage ERP Lifecycle

The Mavim software offers a collaborative modeling environment & communication platform which supports the implementation and setup of an integrated ERP solution during its entire lifecycle. Process activities are connected to the relevant ERP transactions to ensure user adoption during the go-live and post go-live phases of the implementation. The business processes will help guide end-users through their work in connection to the ERP solution.

Facilitate Soft Change

Mavim offers a collaboration platform where you can communicate the new processes, connected roles and ERP transactions to end-users via the Mavim Web Portal or SharePoint/Office365. This helps create organization-wide awareness and ensures user buy-in. With Mavim's collaborative portal functionalities, end-users are prompted to give feedback and follow-up throughout the process, which drives continuous improvement.

SIX DISCIPLINES IN ONE PLATFORM

In one platform, Mavim supports the management and integration of six primary Business and IT Management themes that enable successful transformation. The Mavim proposition is unique in that it empowers organizations to continue to use familiar Microsoft technologies which provides a straightforward environment for the planning and execution of strategic change. Additionally, the Mavim software is infinitely scaleable. Decide where you want to start and expand and adjust the scope as the needs of the business change.

Customers use our software for a variety of improvement initiatives, including quality management, business process management, project portfolio management, operational excellence, lean six sigma, and continuous improvement.
